

A Comprehensive Analysis Of Financial Performance : Insights From A Leading Banks

INTRODUCTION

OVERVIEW

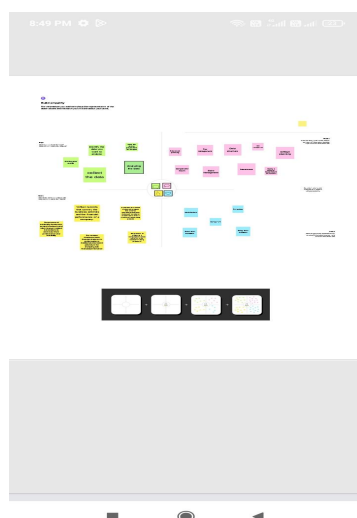

The banking industry world-wide is being transformed .The global include technological innovation ;the deregulation of financial services at the national level and opening -up to international competition ;and equally important -changes in corporate behavior ,such as growing disintermediation and increased emphasis on shareholder value .in addition ,recent banking crises in Asia and Latin America have accentuated these pressures.In this project we are learned to analysis the bank Related data and able to extract some insights from the data using Business Intelligence tools.To Extract the insights from the data and put the data in the form Of Visualizations ,Dashboard and story we employed Tableau tool.

PURPOSE

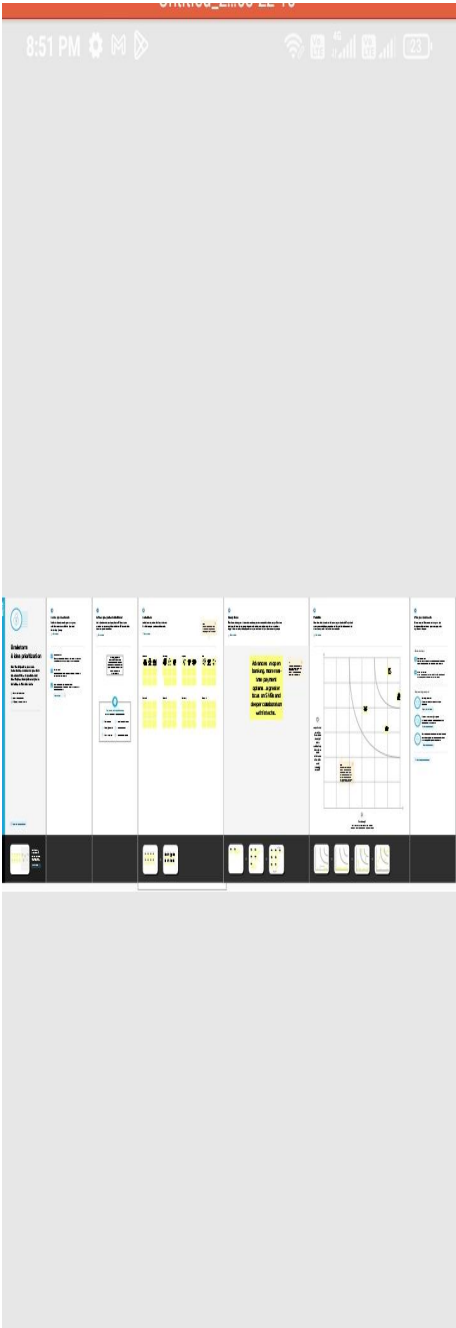

Business deal with a lot of data and analyzing it in its raw form is frequently difficult So Tableau is a data visualization program that allows you to generate basic oriented graph-like data representations by querying cloud databases ,spreadsheets,machine Learning algorithms,social databases ,and other database improvements.

Advantages & Disadvantages

1. Advantages

- **Data visualization**

Tableau is a data visualization tool first and foremost. It's technology is there to support complex computations, data blending and dashboard for the purpose of creating beautiful visualizations that deliver insights that cannot easily be derived from starting at a spreadsheet. It has climbed to the top of the data visualization heap because of it's dedication to this purpose.

- **Quickly create interactive visualizations**

Using drag-n-drag functionalities of Tableau ,the user can create a very interactive visual within minutes.the interface can handle endless variations while also limiting you from creating charts that are against data visualization best practices.

- **Ease of implementation**

There are many different types of visualization options available in Tableau which enhance the user experience. Also,Tableau is very easy to learn compared to Python,Business objects and demo ,anyone without having knowledge of coding can easily learn Tableau Absent Data.

- **Tableau can handle large amounts of data**

Tableau can handle millions of rows of data with ease.Different types of visualization can be created with a large amount of data without impacting the performance of the dashboards. Also,there is an option in Tableau Where the user can make “live” to connections to different data sources like SQL etc.

- **Mobile Support and Respective Dashboard**

Tableau has done a great job climb its way to the top of data visualization tools.So, according to Gartner magic Quadrant .Tableau Dashboard has a great reporting feature that allows you to customize dashboard specifically for a certain device such as a mobile board or laptop.Tableau automatically understands which device the user is viewing the report on and make adjustments to ensure that report is served to the right device.

2. DISADVANTAGES

- **Scheduling or notification of reports**

Tableau does not provide the feature of automatic refreshing of the reports with the help of scheduling.There is no option of scheduling in Tableau .Therefore ,there is always some manual effort required when users need to update the data in the back end.

- **No Custom visual imports**

Tableau's is not a complete open tool .unlike Power BI,developers can create custom visuals that can be easily imported tableau .So,any new visuals need to be recreated instead of imported.

- **Custom formatting in Tableau**

Tableau's conditional formatting and limited 16 column table displays are pain points for users.Also, to implement the same formatting to multiple fields there is no way a user can do that for all fields directly.

APPLICATIONS

Tableau is basically a data visualization tool which provides pictorial and graphical representations of data. In Tableau ,you can gain insights that you never thought possible.You can play with interactive visualizations,deploy data drilling tools and explore various data that is available and with tableau ,it is all about an easy and interactive approach.

MySQL is a relational database management system based on SQL Structured Query Language.The application is used for a wide range of purposes, including data Warehousing e-commerce,and logging applications.

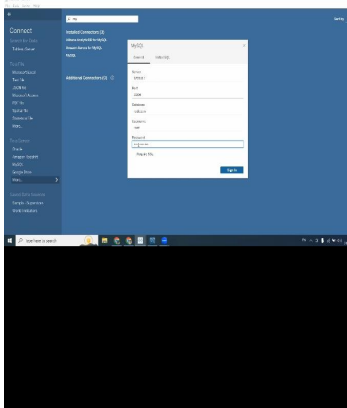

CONCLUSION

From this we can learned briefly about the tableau how can use it and its Applications .We can understand the team work importance,understanding and knowledge capacity. We are learned more about Business requirements ,Data collection,social impacts,SQL operators ,Data preparation,data Visualization and Dashboard.

FUTURE SCOPE

The demand for Data visualization is increasing rapidly and businesses are gaining a huge advantage since it allows them to get actionable insights in very little time so Tableau is most used software for data visualization.This Software provides rapid visualizations and as a result, it helps businesses to make decisions quickly.This project is very useful to my future courier .So thank you for Naan muthalvan team.
